!(brjcancer00409-0151.tif "scanned-page"){.138} Q: No email addresses in apache error log? My apache server started

behaving weirdly yesterday and I have no idea what's going on. It seems all the email addresses associated with my website are no longer showing in my error log (but other data is still showing. I've made sure that I've disabled the mail function in the apache config: Options +Indexes +Includes +FollowSymLinks +Multiviews AllowOverride None Require all granted MailIndexIgnore * And restarted apache, but nothing's working. Is there any reason why this would happen? Here's what the email config looks like: 82157476af
