The game runs on a new engine and Alice Madness returns.1. Field of the Invention The present invention relates to an optical system, and more particularly to a single lens reflex camera with interchangeable lens. 2. Description of the Prior Art Heretofore, various different types of interchangeable lens single lens reflex cameras have been proposed, such as shown in Japanese Laid-open Utility Model Publication No. Sho. 52-44254 and Laid-open Utility Model Publication No. Sho. 53-76035. However, the known interchangeable lens single lens reflex cameras are of complex construction and, thus, the weight of the camera tends to become unduly heavy. Also, they are defective in that the distance from the photographing optical axis to the film surface varies, since the object-to-image distance varies. Furthermore, the spherical aberration and/or astigmatism is great, the maximum image height is large, the spot diameter of the image plane is large, and, thus, the angle of view is poor. In this connection, it is desirable to provide an interchangeable lens single lens reflex camera having the minimum weight, the minimum number of elements and the minimum distortion. Cholinergic and muscarinic cholinergic receptors mediate different effects of adenosine on [3H]tetrodotoxin binding in the rat hippocampus. The muscarinic cholinergic receptor antagonist pirenzepine inhibits the effect of adenosine on [3H]tetrodotoxin binding in the rat hippocampus. In contrast, atropine, a specific antagonist of M1 cholinergic receptors, does not affect the f678ea9f9e
